

Example of right-hand config with left-hand explanation. New sections and modifications are shown in black, existing text is shown paler.

The redirect router.

This router reads information from a new file named:

```
/etc/exim/exim-redirect-mail-for-this-list-of-users.txt
```

It will redirect a message to a new email address if a matching rule is found in the list. In most simple installations this router should be run before all others. This ensures that we are working with the correct recipient information before making decisions on how it should be processed.
